The present invention relates to a method for selectively accumulating a mitochondrial disabling or destructive amount of a conjugate molecule in mitochondria having defective ortochrome c oxidase (COX) activity or displaying increased membrane potential. The method involves contacting mitochondria with a conjugate molecule comprising a targeting molecule conjugated to a toxin, where the conjugate or targeting molecule selected accumulates in the mitochondria. The method is useful for diagnosis of Alzheimer's disease (AD), especially sporadic AD. The present sequence is a PCR primer used in the method of the present invention

GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                           Domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Primer for studying biallelic polymorphic markers in the IBD1 region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                          primers AAI65647-78 were used to characterise biallelic polymorphic markers in the IBD1 gene region. The IBD1 gene encodes an inflammatory bowel disease 1 (IBD1) polypebtide, which is associated with intestinal inflammatory disease. The specification also describes a polypeptide which is in proximity to IBD1, and is designated IBD1prox. The IBD1 gene is probably involved in regulation of apoptosis and activation of NF-kappa B. The IBD1 and IBD1prox polymucleotides are is useful as source of probes and primers, as source of (anti) sense oligonuclectides, for recombinant production of polypeptides, and in screening for interactive compounds. The polypeptides are used to raise specific antibodies which useful for diagnostic detection or purification of IBD1 and IBD1prox polymucleotides and polypeptides are useful for creatment and prevention of inflammatory and/or immune diseases or cancer, where associated with mutations in genes corresponding to IBD1 and IBD1prox, especially cryptogenetic inflammation of the intestines

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 strongly and read as probes to detect, characterise and quantify hGDMLP-1 protein substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunospens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption indisation, as the responsible of the harden captures encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed protein and but was obtained in electronic format directly from MIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP-proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1 in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence on this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip. wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              proteins,

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 uncleic acids in sample, as amplification substrates, to nucleic acids in sample, as amplification substrates, to hGDMLP-1 uncleic acids in sample, as amplification substrates, to protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as concentration and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polymucleotide sequence senceding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart captumence in the expression of hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGMDMLP-1 sequence in the exemplification of the present invention. N. B. Chimble-1 sequence data for this patent did not form part of the printed specific attor, but was obtained in electronic format directly from WIPO at they wipo int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          or as specific biomolecule capture probes for surface-enhanced lases description ionization, comprises human myosin-like protein hGDMLP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; SEQ ID NO 2564; 214pp; English

```
protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL Mast two loaforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a roll similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      mapped to human chromosome 10912.1. HTPL and its coding sequence are mapped to human chromosome 10912.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placente, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for
                                                                                                                                                                                                                                                                                                                                                                                            Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1;

The invention relates to a nucleic acid molecule (1) which down regulates expression of an Ets-related gene (RRG). (1) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    necovascular glauccoms, unyopic degeneration, macural uspationaries, necovascular glauccoms, myopic degeneration, exthitis, psoriasis, vertuca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge wulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge specific statements, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in angiogenesis is treated by administering (I) to the patient in chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of
male infertility and cancer. The present oligonucleotide was used in an example from the invention

The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, langerhans islet in pancreas and cornea, susceptibility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them.
ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ABK17354-ABK22719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and related PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nishida M;

the present and diagnosis of Alzheimer's disease (AD). The method comprises treatment and diagnosis of Alzheimer's disease (AD). The method comprises the use of genetic mutations in the human mitochondrial cytochrome coxidase (COX) gene and their segregation with AD. Alze disclosed are antisense sequences specific to mutant human cytochrome coxidase genes that are designed to bind and inhibit transcription or translation of the carget mutant COX genes without inhibiting transcription or translation of wild-type cytochrome coxidase genes. Also disclosed are probes for detecting a disease state associated with one or more mutations in the mitochondrial COX genes, and a kit comprising a probe for detection of an alzheimer's disease genotype which is complementary to the sense or antisense strands of a mitochondrial COX gene. Definitive diagnosis of Alzheimer's disease can currently only be accomplished by pathological examination at autopsy, the new method provides a non-invasive diagnostic that is reliable at or before the earliest manifestations of AD symptoms. There is at present no effective therapy for AD other than certain compliative treatments. The new therapeutic compositions and methods provide an effective therapy that addresses the primary cause of AD. The present sequence represents a primer for the human mitochondrial COX present sequence represents a primer for the human mitochondrial COX
                                                                                                                                                                                                                                                                                           Alzheimer's disease, AD; human; mitochondrial cytochrome c oxidase; COX; segregation; nootropic; neuroprotective; primer; ss.

The present invention relates to compositions and method for the treatment and diagnosis of Alzheimer's disease (AD). The method comprises the use of genetic mutations in the human mitochondrial cytochrome coxidase (COX) gene and their segregation with AD. Also disclosed are antisense sequences specific to mutant human cytochrome coxidase genes cartisense sequences specific to mutant thuman cytochrome coxidase genes cartisense sequences specific to mutant thuman cytochrome coxidase genes cartisted coxidase genes. Also disclosed are probes for target mutant COX genes without inhibiting transcription or translation of the carget mutant COX genes without inhibiting transcription or translation of the cartism a disease state associated with one or more mutations in the mitochondrial COX genes, and a kit comprising a probe for detection of an Alzheimer's disease genotype which is complementary to the sense or antisense strands of a mitochondrial COX gene. Definitive disagnosis of Alzheimer's disease can currently only be accomplished by pathological examination at autopsy, the new method provides a non-invasive diagnostic that is reliable at or before the earliest manifestations of AD symptoms. There is at present no effective therapy for AD other than certain call addresses the primary cause of AD. The provide an effective therapy that addresses the primary cause of AD. The

The present invention relates to compositions and method for the treatment and diagnosis of Alzheimer's disease (AD). The method comprises the use of genetic mutations in the human mitochondrial cytochrome coxidase (CCX) gene and their segregation with AD. Also disclosed are antisense sequences specific to mutant human cytochrome coxidase genes that are designed to bind and inhibit transcription or translation of the target mutant COX genes without inhibiting transcription or translation of wild-type cytochrome coxidase genes. Also disclosed are probes for detecting a disease state associated with one or more mutations in the mitochondrial COX genes, and a kit comprising a probe for detection of an Alzheimer's disease genotype which is complementary to the sense or antisense strands of a mitochondrial COX gene. Definitive diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Alzheimer's disease can currently only be accomplished by pathological examination at autopsy, the new method provides a non-invasive diagnostic that is reliable at or before the earliest manifestations of AD symptoms. There is at present no effective therapy for AD other than certain palliative treatments. The new therapeutic compositions and methods provide an effective therapy that addresses the primary cause of AD. The present sequence represents a primer for the human mitochondrial COX
                                                                                                                                            Alzheimer's disease; AD; human; mitochondrial cytochrome c oxidase; COX; segregation; nootropic; neuroprotective; primer; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to compositions and method for the treatment and diagnosis of Alzheimer's disease (AD). The method comprises the autations in the human mitochondrial cytochrome coxidase (COX) gene and their segretation with AD. Also disclosed are antisense sequences specific to mutant human cytochrome coxidase genes that are designed to bind and inhibit ing transcription or translation of the target mutant COX genes without inhibiting transcription or translation of the target mutant COX genes that a sesociated with one or more mutations in the mitochondrial COX genes, and a kit comprising a probe for detection of an also and a kit comprising a probe for detection of an alzaeimer's disease genotype which is complementary to the sense or antisense strands of a mitochondrial COX gene. Definitive diagnostic continuation at autopsy, the new method provides a non-invasive diagnostic that is reliable at or before the earliest manifestations of AD symptoms. There is at present no effective therapy for AD other than certain the reliable at the completion and method and method and the compositions and method and method and the completions and method and method and contains and method and contains and method and contains and method and contains and contains and method and contains and contains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The
                                                                                                       Alzheimer's disease; AD; human; mitochondrial cytochrome c oxidase; COX;
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Compositions and methods for the treatment and diagnosis of Alzheimer's disease using nucleic acids related in sequence to (mutants of) the cytochrome c oxidase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The present invention relates to compositions and method for the treatment and diagnosis of Alzheimer's disease (AD). The method comprises the use of genetic mutations in the human mitochondrial cytochrome coxidase (COX) gene and their segregation with AD. Also disclosed are antisense sequences specific to mutant human cytochrome coxidase genes that are designed to bind and inhibit transcription or translation of the target mutant COX genes without inhibiting transcription or translation of the carget mutant COX genes without inhibiting transcription or translation of wild-type cytochrome coxidase genes. Also disclosed are probes for detecting a disease state associated with one or more mutations in the conticendorial COX genes, and a kit comprising a probe for detection of an altoheimer's disease genotype which is complementary to the sense or Alzheimer's disease can currently only be accomplished by pathological commination at autopsy, the new method provides a non-invasive diagnostic that is reliable at or before the earliest manifestations of AD symptoms. There is at present no effective therapy for AD other than certain cylliative treatments. The new therapeutic compositions and methods present sequence represents a primer for the human mitochondrial COX present sequence represents a primer for the human mitochondrial COX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
Alzheimer's disease; AD; human; mitochondrial cytochrome c oxidase; COX;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Compositions and methods for the treatment and diagnosis of Alzheimer's disease using nucleic acids related in sequence to (mutants of) the cytochrome c oxidase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hypersensitivity reaction; abacavir; 57.1 ancestral haplotype; Major Histocompatibility Complex; MHC; human leukocyte antigen; HLA;

This invention relates to a method for determining whether a patient will show a hypersensitivity, or similar, reaction to abacavir by typing the patient for presence of the 57.1 ancestral haplotype of the Major Histocompatibility Complex (MrC). The ancestral haplotype is defined by presence of the human leukcoyte antigen (HLA) subtypes HLA=B*5701, C4A6, HLA-DR7 and HLA-DQ3. Human immunodeficiency virus (HIV) is the actiological agent of a complex disease that includes progressive destruction of the immune system (acquired immune deficiency syndrome, AIDS) and degeneration of the peripheral nervous system. It is known that come antiviral compounds which act as inhibitors of HIV replication are effective agents in the treatment of AIDS. Treatment with an antiviral to a person with hypersensitivity may lead to a range of ailments and occasionally death. Patients who have the 57.1 ancestral haplotype are at nucleoside reverse transcriptase inhibitor (NRT) antiretroviral drug often used to treat HIV and AIDS. The identification method of the Invention may be useful for identifying patients who need to be excluded from treatment with abacavir. The present sequence is that of a human sequencing and PCR amplification primer which was used for identifying the present sequence or absence of the 57.1 ancestral haplotype of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention comprises nucleic acids (e.g. antisense oligonucleotides)

that down regulate the expression or inhibit the function of a receptor

that down regulate the expression or inhibit the function of a receptor

(or a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),

consistent on are useful for treating: exebrovascular accident, central

nervous system (CMS) injury, spinal cord injury, cancer (e.g. melanoma,

lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,

restenosis or asthma), crohn's disease, diabetes, obesity, autoimmune

disease, lupus, multiple sclerosis, transplant/graft rejection,

conditions (e.g. asthma, allergic rhinitis or acpoic dermatitis). The

nucleic acids of the invention are also useful for down-regulating the

expression of a target gene and as a diagnostic tool to examine genetic

drifts and mutations within diseased cells or to detect the presence of a

target RNA in a cell. The present RNA sequence represents a human NOGO

receptor inozyme substrate sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
           protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabetes; obesity; autorimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
that down regulate the expression or inhibit the function of a receptor
(Brappa Kinase (RKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
Lymphoma or gliomal, inflammatory disease (e.g. rheumatoid arthritis,
restencis or asthma), Crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
chifts and mutations within diseased calls or to detect the presence of
target RNA in a cell. The present RNA sequence represents a human NOGO
receptor amberzyme substrate sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                          Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

The invention relates to a nucleic acid molecule that down-regulates cayression of Grb2-related with insert domain (GRID) gene, e.g. a cayression of Grb2-related with insert domain (GRID) gene, e.g. a nammerhead ribozyme, NGH ribozyme, G-cleaver ribozyme, Zinzyme, DNAzyme, anderzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell including the novel nucleic acid molecule, reducing GRID activity in a cell by contacting the cell with the novel nucleic acid molecule, resorging the cell with the novel nucleic acid molecule, an expression certeating the cell with the novel nucleic acid molecule, an expression vector comprising a nucleic acid sequences (encoding at least the novel nucleic acid molecule in a manner that allows its expression), a concleic acid molecule in a manner that allows its expression), a caid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule for treating a condition associated with the level of molecule is useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is a target region for the enzymatic nucleic acides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and

                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                               The invention relates to a composition which contains at least one vector (B) containing a nucleic acid (I) associated with breast cancer. The vector (B), also polypeptides (II) encoded by (I), are used for treatment of breast cancer. Arrays based on (I), (II), or their fragments, and (II) especific antibodies (Ab) are used to predict characteristics (e.g. invasiveness or stage) of breast cancer, and (I), or its fragments, are used to modulate characteristics of such cells; to identify breast cancer genes and to detect breast cancer (by detecting polymorphic nucleic acid or its products). The present sequence represents a human ER+ breast cancer differentially expressed sequence.
                                                                                                                                       Vector containing nucleic acid associated with breast cancer, useful for treating, diagnosing and characterizing breast cancer, also related polypeptides and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                нимап; вв; probe; myosin-like protein-l; hGDMLP-l;

The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 95% deviation from (S1) which are conservative substitutions, and 55% identity to (S1). A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; 88; probe; myosin-like protein-1; hGDMLP-1;
hGDMLP-1 agonist hGDMLP antagonist; hGDMLP inhibitor; heart disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids fully (S1), 95% deviation from (S1) which are conservative substitutions, and 65% identity to (S1). A polypeptide of the invention acts as a agonist or pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of preventing a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63102
                                                                                                                                                                                                                                                                                         Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; 88; probe; myosin-like protein-1; hGDMLP-1;
hGDMLP-1 agonist hGDMLP antagonist; hGDMLP inhibitor; heart disorder;
skeletal muscle function.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel polypeptide (I) comprising a sequence (SI) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (SI), 95% deviation from (SI) which are conservative substitutions, and 65% identity to (SI). A polypeptide of the invention acts as a agonist or paragonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of phGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63102
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Primer hUCP2g.e6rl is used with forward primer hUCPg.e6fl (see AAV44607) in the PCR amplification of bp 3147-416 in exon 6 of the human uncoupling protein-2 (UCP2) gene. Primers (see AAV4460.18) were designed to amplify hUCP2 exons 4, 6, 7 and 8 from genomic DNA. Common amino acid variants (see AAW69166) are present in exons 4, 6 and 8; A55V in exon 4, N190S in exon 6, see also AAV4459. Restriction enzymes have been been identified that would differentially digest each of the alleles. The invention relates to a method for treating disease associated with altered UCP2 expression, such as obesity, diabetes, syndrome X, hypothermia, hyperinsulinaemia, glucose intolerance, wasting, anorexia, inflammation, cachexia, fever or hyperthermia
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Method for treating disease associated with altered UCP-2 expression - by administering agent which enhances or inhibits UCP-2 activity, effectively to treat obesity, diabetes, fever, hyperthermia, cachexia

                                                                                                                                                                                                                                               The invention provides a method for detecting a US (sub)type hepatitis E virus (US-HEV), or its naturally occurring variants in a sample by treatment with a binding partner specific for a marker of the virus, and then detecting any complex formed. The method is used to diagnose infection with US-HEV. Polypeptides from US-HEV, antibodies appecific for open reading frames (ORF) in US-HEV and host cells expressing these ORFs are useful in vaccines or for passive immunisation. The polypeptides are also used to raise specific antibodies (useful as immunoassay reagents). Fragments of nucleic acid from US-HEV are useful as primers and probes in usual hybridisation and amplification agesays for detecting infection. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nuclectide sequences. AAZ65579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the
                                                                                                                                                                                                                                                                                                                                                     ö
                                                                          This sequence represents a direct repeat from the Hz-1 persistence-associated gene 1 (Hz-1 pag1). The invention relates to the Hz-1 pag1 promoter. The pag1 gene promoter is useful in insect calls for driving constitutive expression of e.g. genes encoding foreign proteins. The promoter of the pag1 gene is constitutively expressed and stronger than that of the polyhedrin gene in insect calls, enabling it to express foreign genes more strongly e.g. lacZ and luciferase, in addition to which it can be expressed more prominently as a short promoter. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel biallelic markers used to construct a high density disequilibrium

ARZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nuclectide sequences. AAZ69579 to AAZ7740 represent amplification.

C primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the climater action of a disease as well as other treatment. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and a propert invention a sequence in the Sequence Listing from the

AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from differential efficacious responses to and side effects from the agents acting on a disease as well as other treatment.

The invention relates to agap vector (GV) for assaying Escherichia coli (B.coli) stop codon. The invention also relates to a method for assaying heteroxygous truncating mutation using the GV comprising heteroxygous truncating mutation using the GV comprising the following steps: (1) multiplying exon fragments showing truncating mutation by polymerse chain reaction (PCR) and cloning the exon fragments with a plasmid for B. coli having a low copy number; (2) using the plasmid having cloned exon gene as a template and performing PCR with a primer having 50-200 bp of 5' and 3' terminals of the exon gene to make a gap vector for B. coli stop codon assay; (3) multiplying the same genetic fragment as the multiplied exon fragment through RT-PCR or PCR using RNA obtained from a sample to be measured or cDNA as a cor PCR using RNA obtained from a sample to be measured or cDNA as a complate; and (4) transforming the gap vector obtained from step (2) and the genetic fragment obtained from step (3) into B. coli at the same time
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 p53;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention describes a method for determining the methylation status of CpG dinucleotides within the genes for oestrogen receptor, p21, p27, p16, progesterone receptor, myoglobin, pend, cdC2, c-eral2, p53 and/or CEA, which comprises contacting the target nucleic acid with a creagent that distinguishes between methylated and non-methylated CpG dinucleotides, and determining from the methylation status of 6 the CpG positions the presence of a colon cancer. A set of oligomers or peptide nucleic acid (PNA)-oligomers can be used as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNP) of a corresponding genomic DNA by analysis of a chemically pretreated genomic DNA is useful for the determination of the methylation status of a corresponding genomic DNA and pretreated genomic DNA are also useful for the characterisation, classification, diagnosis and differentiation of colon call provider and pretracted genomic DNA and differentiation of colon call providers and pretracted genomic DNA and site of colon characterisation, classification, diagnosis and differentiation of colon call provider and pretracted genomic DNA represent sequences call provider and pretracted genomic DNA represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The present invention describes a method for determining the methylation status of CpG dinucleotides within the genes for oestrogen receptor, p21, p27, p16, progesterone receptor, myoglobin, pena, cdc2, c-erB2, p53 and/or CEA, which comprises contacting the target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides, and determining from the methylation status of the CpG constitions the presence of a colon cancer. A set of oligomers or peptide nucleic acid (PNA)-oligomers can be used as probes for determining the curresponding genomic DNA by analysis of a chemically pretreated commic DNA. The pretreated genomic DNA is useful for the determination of the methylation status of a corresponding genomic DNA and/or detection of the methylation classification, diagnosis and differentiation of colon cell proliferative disorders. ACF62275 to ACF63278 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Otsuki T, Wakamatsu A, Sato H, Ishii S;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠે
                                                                                                                                                                                                                                                                                               ö
                                                                                               The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a method of genetically screening for detecting thereditary hearing-loss. The method comprises detecting a nucleic acid from a connexin 26 (Cx26), a mitochondrial gene and/or a Cytomegalovirus (CMV) gene by hybridisation and/or PCR. The methods of the invention are represents a primer used in the isolation of DNA encoding the human connexin 26 (Cx26) mutant Cx26 235 Del.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Genetically screening for detecting hereditary hearing loss by detecting connexin 26, a mitochondrial or Cytomegalovirus nucleic acids by hybridization and/or PCR.
                                                                                                                                                                                                                                                                                              Gaps
                       New polynucleotides and polypeptides are useful in gene therapy, developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of diagnosing non-small cell lung cancer (NSCLC) or a predisposition to developing NSCLC in a subject by determining the expression level of a NSCLC-associated gene in a biological sample derived from the subject, where an increase or decrease of the level compared to a normal control level of the gene indicates that the subject suffers from or is a trisk of developing NSCLC. The method is useful in diagnosing NSCLC or a predisposition to developing NSCLC in a subject. The compound, polynucleotide and the encoded NSCLC in this sequence corresponds to an antisense oligonucleotide of genes that are differentially expressed in NSCLC cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

```
The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82215 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                   Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                         New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for predicting the responsiveness of a subject with a cell proliferative disorder of the breast tissues to a therapy comprising analysing the methylation pattern of a target nucleic acid by contacting at least one of the target nucleic acids in a biological sample obtained from the subject prior to or during treatment. The method of the invention has cytostatic activity, and may have a use the property. The set of oligonactic activity, and may have a use the oligoners are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) within the sequences. The methods, nucleic acid, oligonucleotide, and kit are useful for the creatment, characterisation, classification and/or differentiation, of breast cell proliferative disorders. The method is also useful for predicting the responsiveness of a subject with a cell proliferative is used in the breast tissues to a therapy. The present sequence is used in the breast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                              The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCKN and Cyclin B1.

Representative examples of ribozyme recognition sites are given in AA884315 to AA868797. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention specifically claims AAH56368 to AAH56832 which are antisense oligonucleotides to nucleotide sequences encoding groß. More generally, antisense compounds (1) comprising antisense oligonucleotides of 5-50 bases targeted to a nucleotide sequence encoding großL (heat shock protein (HSP) 60) (GL) and groß (HSP10) (GS) gene from a microorganism, where the antisense compound is complementary to GL or GS of a microorganism and specifically hybridises with and inhibits the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense oligonucleotide; groE; groEL; groES; inhibitor; growth; microorganism; Bscherichia coli; Streptococcus pneumoniae; diagnosis; Streptococcus pyogenes; sphylococcus aureus; Pseudomonas aeruginosa; antibacterial; antiviral; antiproliferative; antisense therapy;

                                                 The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operally linked to a nucleic acid segment encoding [1]. (1) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, cepthalmological, vulnerary, keratolytic and virucide activities, and claves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (1) and (11) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, aquamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing carring such as keloid, adhesion and hypertrophic or hypertrophic burn car. AAHSTST7 to AAHSC2099 represent sequences used in the

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, dermatcological, cytostatic, antiseborrheic, antidiabetic, antisickling, dermatcological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [1] are useful for treating proliferative skin diseases such as postiasis, atopic dermatitis, actinic keratosis, aquamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, etchnopathy, sickle cell retinopathy, of prematurity and retinal detachment, and for treating and preventing cararing such as keloid, adhesion and hypertrophic or hypertrophic burn and second in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pyrococcus furiosus; thermophilic glucoamylase; starch decomposition; glucose; oligosaccharide; cyclodextrin; genetic engineering; PCR primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polypeptides with thermophilic glucoamylase activity and high thermal stability, applicable in efficient utilization of biomass e.g. in decomposing starch to produce glucose or oligosaccharides or cyclodextrins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

```
furiosus having thermophilic glucoamylase activity. Also described are:

(i) a nucleic acid encoding the protein; (ii) a nucleic acid hybridisable
with any of the above nucleic acids under stringent conditions and
concoding a protein with thermophilic glucoamylase activity; (iii) a
recombinant DNA contains the nucleic acid; (iv) a transformant which is
cransformed with the recombinant DNA; (v) a process for producing the
transformed with the recombinant bolor collecting the protein that
has thermophilic glucoamylase activity from the cultured material; and
(vi) a process for producing glucose by the action of the above protein
con the alpha-1,4 linkage in a D-glucopyranose polymer to produce free
glucose, or oligosaccharides, or cyclodextrin. The proteins are
applicable in efficient utilisation of biomass e.g. in decomposing starch
to produce glucose or oligosaccharides or cyclodextrins. Such proteins
can be produced by genetic engineering at low cost. The present sequence
represents a PCR primer for a Pyrococcus furiosus protein having
thermophilic glucoamylase activity, which is used in an example from the

New short interfering nucleic acid, useful e.g. for treatment and

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human insulin-like growth factor 1

C creceptor (IGF-IR) gene by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double. Stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain decoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the IGF-IR gene in cells, tissue explants or organisms of sinA; and vectors the express siNA. The siNAs are used to modulate expression of the IGF-IR gene in cells, tissue explants or organisms concerned to a variety of conditions. They may be used for treating cancer and other proliferative diseases (e.g., restenosis and polycystic diseases and transplant rejection. The siNAs are also useful for drug cancer and other proliferative diseases (iscuedate) and validation, genetic engineering, pharmacogenomics, studying gene function, and gene cancer the lower strand of a human IGF-IR-targeted double-stranded constrained a human IGF-IR-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
diagnosis of cancer , downregulates expression of the insulin-like growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human IGF-1R transcript target sequence/siNA upper strand, SEQ ID NO:222.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to short interfering nucleic acids (siNA) which comparison of the human insulin-like growth factor 1 creeptor (IGF-IR) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They comprise ribonucleotides and antisense regions, or alternatively are further comprise sense and antisense regions, or alternatively are sesembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), doublect stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain contain an enzymatically synthesised. The invention also relates to kits of the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs and can do modulate capression of the IGF-IR gene in cells, tissue explants or organisms of cancer and other proliferative diseases (e.g., restenosis and polycystic kidney disease), inflammatory and/or allergic diseases, autoimmune concerning, disease), inflammatory and/or allergic diseases, autoimmune conserving, diseases and transplant rejection. The siNAs are also useful for drug cancer and other proliferative diseases (e.g., restenosis and polycystic denesing, disease), inflammacogenomics, studying gene function, and gene conservation, is identical to the IGF-IR transcript strand of a human IGF-IR-targeted double-stranded size and the identical polymorphisms). The present sequence conservative in the identical polymorphisms. The represent sequence of the identical polymorphisms of the identical polymorphisms of a human identical representation and validation.
                                                                                                                                                                                                                                            New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of the insulin-like growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human; single nucleotide polymorphism; microarray; side effect; ss;

The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA primer set chosen from the combination of two DNA regentification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide olymorphisms in human gene. The isolated human gene is also effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide obolymorphisms in a human gene. This polymorleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism cone of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel small interfering RNA (siRNA) polynucleotides capable of interfering with expression of a polypeptide having protein-tyrosine-phosphatase (PTP) activity. The products of the invention have cytostatic, immunomodulator, antimicrobial, antifical manatory, antidiabetic and anorectic activity. The methods and compositions of the present invention are useful for treating diseases or conditions associated with aberrant expression or activity of the protein tyrosine phosphatase, such as cancer, autoimmune diseases, infection, inflammation, diabetes and obseity. This sequence represents a siRNA directed against dual specificity phosphatase (DSP) expression.
                                                                                          The invention comprises the amino acid and coding sequences of nucleotide binding site (NBS) proteins from the Oryza minuta Pi9 locus (bacterial blight and rice blast resistance genes). The DNA sequences may be used as markers for resistance to infection with Manaporthe grises in plant breeding programs. The present DNA sequence represents a PCR primer for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated small interfering RNA (siRNA) polynucleotide useful for treating diseases with aberrant activity of the protein tyrosine phosphatase, such as cancer, autoimmune disease, infection, inflammation, diabetes and obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           small interfering RNA; siRNA; protein-tyrosine-phosphatase; PTP;

The products of the invention have cytostatic, immunomodulator, antimicrobial, antidiabetic and anorectic activity. The methods and compositions of the present invention are useful for treating diseases or conditions associated with aberrant expression or activity of the protein tyrosine phosphatase, such as cancer, autoimmune diseases, infection, inflammation, diabetes and obesity. This sequence represents a siRNA directed against dual specificity phosphatase (DSP) expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated small interfering RNA (siRNA) polynucleotide useful for treating diseases with aberrant activity of the protein tyrosine phosphatase, such as cancer, autoimmune disease, infection, inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gарв

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of detecting the base sequence for RNA interference by detecting the regions in the DNA sequence fulfilling the following requirements such as: (i) the base at 3' terminal is adenine, thymine or uracil; (ii) the base at 5' terminal is guantine or cytosine; (iii) the base as 3' terminal is guantine or cytosine; (iii) the seven base sequence at 3' terminal is rich in adenine, thymine and uracil, and; (iv) there are bases in a such a number that it causes RNA interference without showing cytotoxicity. The method is used for designing and synthesizing siRNA causing RNA interference. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting sequence of RNA interference useful for synthesizing siRNA, by detecting regions in sequence fulfilling specific criteria such as base at 3' terminal is adenine, thymine or uracil, base at 5' terminal is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      short inhibitory RNA; siRNA; adipocyte; cell membrane; electroporating; permeabilised cell membrane; antidiabetic; anorectic; gene therapy; type II diabetes; insulin resistance; obesity; Myolc; ds; mouse; murine.

                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a novel method of introducing a nucleic acid into an adipocyte which comprises contacting an adipocyte having a cell membrane with a nucleic acid molecule, thus forming a mixture and electroporating the mixture under conditions such that the cell membrane becomes permeabilised, such that the nucleic acid is introduced into the adipocyte. The invention may be useful for the production of compounds with an antidiabetic or anorectic activity whilst the disclosed sequences may be useful for gene therapy. The methods are useful for treating type II diabetes, insulin resistance or obesity. The present sequence is that of a region of a gene which may be targeted by short inhibitory RNA (siRNA) used with the method of the invention.
                                                                                                                                                                                                                                                            I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            short inhibitory RNA; siRNA; adipocyte; cell membrane; electroporating; permeabilised cell membrane; antidiabetic; anorectic; gene therapy; type II diabetes; insulin resistance; obesity; Myolc; ds; mouse; murine.

                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                            This invention relates to a novel method of introducing a nucleic acid membrane and adipocyte which comprises contacting an adipocyte having a cell membrane with a nucleic acid molecule, thus forming a mixture and electroporating the mixture under conditions such that the cell membrane becomes permeablised, such that the nucleic acid is introduced into the adipocyte. The invention may be useful for the production of compounds with an antidiabetic or anorectic activity whilst the disclosed sequences may be useful for gene therapy. The methods are useful for treating type II diabetes, inaulin resistance or obesity. The present sequence is that of a region of a gene which may be targeted by short inhibitory RNA (siRNA) used with the method of the invention.
                                           Introducing a nucleic acid into an adipocyte, useful for treating type II diabetes, obesity or insulin resistance, comprises contacting an adipocyte having a cell membrane with a nucleic acid molecule, thus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a method for identifying a target cell or for allowing direct genetic analysis of target cell, the method involves in

complementary labeled sequence, and identifying the target cell with a complementary labeled sequence, and identifying the target cell by a detecting the presence of a hybridised sequence by flow cyrometry. The method of the invention is useful for distinction of foetal and maternal cells and can be used in prenatal disgnosis for the detection of cystic fibrosis or chromosomal aberrations such as trisomy 21 (Down's syndrome). The method is also useful for the disgnosis of diseases which are due to or characterised by the transcription of genes which are not expressed in the wild type cell, or diseases characterised by the absence of altered expression or expression rates of certain genes or gene fragments. This method improves the identification of foetal cells within a maternal and companies and therefore enables the distinction between maternal and companies than common practices and increases the overall sampling rate of target cell within a blood sample. The method also allows simultaneous which can be combined with the detection of various genetic difference within the cells at once. The method also allows detection of rare conjunction with the primer represented in AbRASO71 as a control PCR and conjunction with the primer represented in AbRASO71 as a control PCR and conjunction with the primer represented in AbRASO71 as a control PCR and control and publication of the number of target cells used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New peptides having growth inhibitory action, useful for inhibiting tumor or cancer cell proliferation, or for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cytostatic; platelet-derived growth factor receptor; PDGF-R; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     carcinoma; sarcoma; osteosarcoma; glioma; melanoma; myxoma; adenoma; neuroblastoma; rhabdomyoma-derived cell; fibrotic disorders; myeloproliferative disease; blood vessel proliferative disease; anglogenesis.

The invention relates to an isolated peptide or polypeptide (I) of no more than about 50 amino acid residues which when contacted with cells in which a platelet-derived growth factor receptor (PDGF-N) is activated in an autocrine manner, inhibits the growth of these cells. The isolated peptides or polypeptides preferably have the sequences: Lys-Lys-Lys-Lys-Lys (PI) Asp-Asp-Glu-Glu-Lys (P2) Lys-Leu-Met-Ser-Tyr (P3) Phe-Phe-Phe-Lys (P4) Phe-Phe-His-Pro-Val (P5). (I) is useful for inhibiting cell proliferation, where the cell is a tumor or cancer cell (e.g. carcinoma, sarcoma, osteosarcoma, glioma, melanoma, myxoma, adenoma, neuroblastoma, or rhabdomyoma-derived cell), lung, breast, colon, prostate, kidney,
                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New peptides having growth inhibitory action, useful for inhibiting tumor or cancer cell proliferation, or for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic)
peptides or polypeptides preferably have the sequences: Lys-Lys-Lys-Lys-Lys-Lys-Lys (P1) Asp-Asp-Glu-Glu-Lys (P2) Lys-Leu-Met-Ser-Tyr (P3) Phe-Phe-Phe-Lys-Lys (P4) Phe-Phe-His-Pro-Val (P5). (I) is useful for inhibiting cell Lys-Lys (P4) Phe-Phe-His-Pro-Val (P5). (I) is useful for inhibiting cell proliferation, where the cell is a tumor or cancer cell (e.g. carcinoma, sarcoma, osteosarcoma, glioma, melanoma, myxoma, adenoma, neuroblastoma, or rhabdomyoma-derived cell), lung, breast, colon, prostate, kidney, ovary, testicular, skin, pancreatic, thyroid, adrenal, pituitary, brain, muscle or bone cell. The peptides are also useful for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic) disorders. This sequence represents a possible nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cytostatic; platelet-derived growth factor receptor; PDGF-R; cancer;

Also included is an expression vector comprising a nucleic acid sequence encoding siRNA molecule (s) in a manner that allows expression of the nucleic acid molecule. The siRNA molecules comprise hammerhead ribozymes, inozymes, amberzymes and DNAzymes. The invention is used for inhibiting expression of EGFR. It can be used for treatment of cancer, prostate cancer, bladder cancer, brain cancer, cervical cancer, stomach cancer, ovarian cancer, melanoma, lymphona, glioma, multidrug resistant cancer or a brain tumour. The invention has enhanced shalf-life, half-life in vitro, stability, and ease of introduction of oligonucleotide to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HER4; hammerhead ribozyme; Inozyme; zinzyme; DNAzyme; amberzyme; cancer; brain tumour; cytostatic; short interfering RNA; siRNA; RNA interference; prostate cancer; colorectal cancer; brain cancer; oesophageal cancer; stomach cancer; bladder cancer; pancreatic cancer; cervical cancer; head and neck cancer; ovarian cancer; melanoma; lymphoma; glioma; multidrug resistant cancer.
ovary, testicular, skin, pancreatic, thyroid, adrenal, pituitary, brain, muscle or bone cell. The peptides are also useful for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic) disorders. This sequence represents a possible nucleotide encoding the P3 peptide.

pCR primers AAH77878-79 were used to amplify cDNA encoding a human polypeptide, designated hB7-H2. The hB7-H2 polypeptide co-stimulates T cells. The hB7-H2 proteins and its variants are generally useful as immune response-stimulating therapeutice. For example, the polypeptides can be used for treatment of disease conditions characterized by immune used for treatment of disease conditions characterized by immune deficiencies. They may also be employed to increase immune immune deficiencies. They may also be employed to increase immune therefore are particularly useful when use of radiotherapy or immune used to treat conditions used to a certain conjunction with such therefore are particularly useful when given in conjunction with such therefore are particularly useful when given in conjunction with such used to treat conditions involving cellular immune responses, e.g., inflammatory conditions (such as, for example, those induced by infectious agents including Mycobacterium tuberculosis or M. leprae), or infectious agents including Mycobacterium tuberculosis or M. leprae), or
                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     An isolated DNA encoding a hB7-H2 polypeptide, useful for treating cancer, AIDS, or autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis or insulin-dependent diabetes mellitus).

The composition, methods and kit are useful for diagnosing, predicting of clinical course and treating stroke using polymorphisms in the PDE4D general and any also be used in identifying agents that enhance or inhibit PDE4D polypeptide expression or activity. The present sequence represents a fragment of H. pylori strain J99 genome which is not referred to at all in the main body of the specification.

The invention relates to a method of diagnosing susceptibility to a stroke in an individual comprising screening for an at-risk haplotype in the phosphodiesterase 4D (PDE4D) gene that is more frequently present in an individual susceptible to stroke (affected) compared to a healthy individual (control), where the at-risk haplotype increases risk of stroke significantly. The composition, methods and kit are useful for diagnosing, predicting of clinical course and treating stroke using polymorphisms in the PDB4D gene. These may also be used in identifying agents that enhance or inhibit PDE4D polypeptide expression or activity. The present sequence represents a fragment of H. pylori strain J99 genome which is not referred to at all in the main body of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠ
                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                              The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRR-2 and/or the CAAT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                               Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRR-2 and/or the CAMT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                   The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TR-1, the GATA transcription factor gene, IRR-2 and/or the CAATH Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                             Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of errthropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to a nucleic acid molecule which down regulates expression of a cutter of a cut molecule which down regulates expression of a neurite growth inhibitor gene (MoZO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a numberzyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with an NCH motif) properson or an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a NGN with a relative collour the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, it may be contacted with a call to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20: The treatment may further comprise the use of one or more the cation in particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, HUV (human immunodeficiency virus) associated will, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, implementation of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the cargetting nucleic acid may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the call and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more central nervous system (CNS) injury and cereboxoscular accident (CVA, stroke), Allaneimer's disease, dementia, multiple sclerosis (MS), arkington's disease, central particular, thurington's disease, central particular dystrophy, and/or other neurodegenerative disease central response of the respection of the modular dystrophy, and/or other neurodegenerative of the present cation the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; 88; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOG0; hammerhead ribozyme; DNAzyme; inozyme; G-cleaver; amberzyme; zinzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; human immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis;
                                                                                                      Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and

The invention relates to a nucleic acid molecule which down regulates expression of a cD20 gene and a nucleic acid molecule which down concreasing the systems of a neurite growth inhibitor gene (NG20). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids and NGH molecule possessing an NGH molif), a G-cleaver (cleaving RNA with a NRY motif) propersessing an NGH molif), a G-cleaver (cleaving RNA with a NRY motif) propersessing an NGH molif), a G-cleaver (cleaving RNA with a NGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably MG 2+.

Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more the reatment may further comprise the use of fone or more theory of the CD20. The treatment may further comprise to the use of fone or more cleavemin's lymphoma (NRL), bulky low-grade or follicular NHL, lymphocytic lymphoma (NCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, cleave MRL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (IMC) are differency virus) associated with mattle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (IMC) are differency of the nord of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the concentral nervous system (CNC) arithory and creabency and treat a patient having a condition associated with the level of NOCO. The treatment may further comprise the use of one or more (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy and/or other neurodegenerative disease central response the modular dystrophy, and/or other neurodegenerative disease centered a day of the cannere of a day an amherywhen molecular di

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neurite growth inhibitor gene (NAGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a consessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) properessing an NCH motif). The CD3-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD3-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD3-targetting nucleic acid is used to cleave RNA coff CD3 in the presence of a divalent cation that is preferably MG<sup>2</sup> +. Furthermore, it may be contacted with a cell to reduce CD3 activity of the cell and treat a patient having a condition associated with the level coff CD3. The treatment may further comprise the use of one or more therapies. In particular, the CD3O targetting nucleic acid may be used to treat lymphoma (HML), bulky low-grade or follicular nontreat lymphoma (MCL), immunodeficiency virus) associated MHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma and inflammatory arthropathy. The NOGO-

presence of a divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, staxia, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present

                  The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterises and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunospens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed production.
                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

Thurster actual cards in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 provide initial substrates for the recombinant engineering of hGDMLP-1 provide initial substrates for the recombinant engineering of hGDMLP-1 proteins or polypeptides may be expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specific and concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as concentration to production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The colorate associated with the expression of hGDMLP-1 in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the specification of the present invention. N.B.

                                                                                                                                                                                                                                          New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates to hGDMLP-1 nucleic acids in samples, as amplification substrates to browned initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP-proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The production and in vaccines and holymlp-1 may be used for diagnoshing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 may be used for diagnoshing of the present sequence in the exemplification of the present invention.

The present sequence for this patent did not form part of the printed production, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                               New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The present invention describes a human genome-derived myosin-like concein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used as probes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for protein variants having desired phenotypic improvements, and for caypressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therefore and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polyuncleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart con and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B.

The sequence data for this patent did not form part of the printed form and shell and the present invention. The present captured in the analysis of the present invention. N.B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention relates to human testis expressed Patched like protein (HTPL, see ABN78759 to ABN7862 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in the trapped to human chromosome 10pl2.1. HTPL and its creatment or prevention of useful for diagnosing a disorder caused by mutation in HTPL, and in the trapped to human disorders include disorders of testis, or adrenal, adult and feetal liver, bone marrow, brain, kidney, lung, placenta, prostate.

C skeletal muscle or colon function. HTPL proteins and nucleic acids are callingally useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two isoforms, with a few single base pair differences between the two of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is minar chromosome loppiz.1. HTPL and its coding sequence are usepul for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful disapnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                          Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.

The invention relates to a nucleic acid molecule (I) which down regulates corporates and the state of an Eta-related gene (ERG). (I) is useful for treating corputations selected from cancer, lymphoma, Ewing's sarcoma, metanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, conditions selected from cancer, lymphoma, arthritis, psoriasis, verruca vulgaris, angiofibroma of tubercous sclerosis, port-wine stains, Sturge weber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu cyndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, to y contacting ocals of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies conduction suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a coll by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to the presence of ERG RNA in a cell. (I) is useful for specifically trangeting genes that share homology with ERG gene or ERG fusion genes.

Changeting genes that share homology with ERG gene or ERG fusion genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer. diahatic rationathy.
